GAS SCRUBBING TECHNOLOGY

‘BECOFLEX’ ROTARY BRUSH GAS SCRUBBER & DE-DUSTING SYSTEM

PACKED BED SCRUBBERS

VENTURI SCRUBBERS

WET CYCLONE SCRUBBERS

CROSS-FLOW SCRUBBERS

DUST & FUME SCRUBBERS
'BECOFLEX' Rotary Brush Scrubber

A universal, integrated scrubber system to remove solids (coarse or fine), to abate liquid particles (aerosols or droplets), or to scrub noxious gas, present in any industrial gas flow.

Technology

The ‘BECOFLEX’ principle of operation is a wetted fibre brush rotating at high speed in a special volute fan casing, thus creating an extremely dynamic gas contact.

Particles in the dirty exhaust gas stream are drawn into the unit by the suction generated by the rotary brush, and they impact at high speed with the spinning brush fibres and become thoroughly wetted. The next effect is for the particles to be centrifugally washed off, to impact on the wetted inner surface of the volute.

The resulting slurry is then propelled along the bottom of the exit duct to the disengagement vessel, where it falls by gravity to the bottom for removal or recirculation.

The cleaned (wet) gas meanwhile flows upwards from the duct into the disengagement vessel and towards the top gas exit. Usually a ‘Becoil’ demister is fitted to remove any entrained liquid droplets.

The BECOFLEX system is compact and acts as its own air mover. This usually means there is no need for a separate fan, but in some cases a secondary or main fan is also used, particularly with long upstream processes.

In comparison with the power consumption of a conventional fan, the BECOFLEX will draw up to 60% volume flow for the same power.

The BECOFLEX is a SCRUBBING PROBLEM SOLVER

The BECOFLEX technology is beautifully simple, which appeals to all engineers - often solving a problem with existing scrubbing systems. Alternative gas scrubbing technologies can have disadvantages, such as:

**Packed Towers** have random or structured packing, which block relatively easily with any solids in the gas.

**Wet Cyclones** have medium efficiency only on smaller particle sizes. Also large liquid volumes are required.

**Venturis** are very efficient, but have high energy requirement, high capital cost and high liquid volume.

However, BECOFLEX’s main benefits are:

- It is a self-cleaning wet gas scrubber, where the gas or air impacts on the spinning brush, which is sprayed with low volume liquid. This dynamic action gives excellent gas/liquid contact and means the unit can be very compact.

- It can handle solids removal with less liquid in & effluent than conventional towers or wet cyclones.

- It can use water or any chemical solution for gas absorption or odour control.

- It can be fitted with packings or other 2nd stage equipment for more complex gas absorption duty (the 1st stage brush having removed any solids blockage risk).

- It acts as its own air moving fan as the brush creates more than just the suction to overcome its own pressure loss, so not only is no separate fan required, it also means it is usually easy to retrofit it to existing process lines.

- It can act as a solids removal pre-filter in front of, and protecting mist eliminators.

BECOFLEX Rotary Brush Scrubber Materials

The BECOFLEX brush fibres are made of Polypropylene or PVDF so there is a 100°C temperature limit at the inlet. Spray cooling before the volute may be suitable in some cases. A metal brush can be supplied for BF33 and BF40

The standard materials for the volute and vessel are Carbon Steel, Stainless Steel, Polypropylene / GRP
**BECOFLEX Design Options**

There are 5 main Design options for the BECOFLEX Technology. A Standard design BF, combinations with sprays and different types of contact bed BFA / BFC / BFP, and a combination with mist eliminators BFCF.

**BECOFLEX BF Units Flow / Suction Options**

The Table below shows the Flow rate options for each BECOFLEX BF and BFA Unit, at 3 different Fan Static Pressure (Suction) values.

**Note 1**: For flows larger than 25,000 m³/hr we combine fan volute units in parallel, feeding into a common exit vessel.

**Note 2**: For BFC, BFP and BFCF Units, the Flow rate will be lower than shown in the table, due to the extra resistance caused by the filter / packing.

**BECOFLEX BF Unit Size and Other Data**

The Physical Size, Motor Size and Liquid Spray Rate data for each BECOFLEX BF Unit is shown in the table below.

'BEGG COUSLAND' Gas Scrubbers
Begg Cousland can design and supply all types of gas scrubbing equipment, either as 'end-of-pipe' pollution control or as a gas cleaning stage within a process.

Gas scrubbers are all designed to ensure a good contact and mixing between gas and liquid, usually for Absorption Odour control or Particulate removal. Desorption and Distillation are also mass transfers done in columns. Below are the most common designs we supply.

Option 1. Conventional Packed Bed Scrubber

This design removes gas by absorption or by chemical reaction. Suitable for odour control also.

Option 2. 2 Stage Packed Bed Scrubber

This design removes 2 different gases by absorption or by chemical reaction with different liquors with a dividing tray. Suitable for 1st stage ‘stripping’ and 2nd stage scrubbing.

Packed bed scrubbers are designed to give excellent gas / liquid contact and residence time for the reactions, but can be blocked by solid particulates. Where solids are present it is best to use a different design or have a solids removal stage first, to prevent the fouling of the packings. Begg Cousland offer the BECOFLEX technology for wet removal of solids and cross-flow scrubbers equipped with BLUEFIL® structured mesh packing stages.

Option 3. 4 Stage Cross-Flow Scrubber

High energy / high efficiency Venturis use a cyclone stage afterwards, and can remove 0.1 micron dust. It is not prone to blockage. Eductor Venturis are used where ‘sticky’ solids are present or where the high liquid flow can condense.

Option 4. Eductor Venturi Scrubber

Option 5. Venturi Scrubber + Cyclone

Option 6. Combination Venturi + Packed Bed

PHOSPHATE FERTILISER PLANT
GAS SCRUBBING TECHNOLOGY

CROSS-FLOW SCRUBBERS (BLUEFIL®)

‘BEHFLEX’ ROTARY BRUSH GAS
SCRUBBER & DE-DUSTING SYSTEM

VENTURI, WET CYCLONE &
PACKED BED SCRUBBERS
'BEGG COUSLAND' Cross-Flow Scrubbers

Begg Cousland can design and supply all types of gas scrubbing equipment, either as 'end-of-pipe' pollution control, or as part of a process.

In Phosphate Fertiliser plants (MAP / DAP / NPK) there are many applications for scrubbers to capture solids, aerosols, fumes or gases, most of which have inherent difficulties of blockage and the need for regular maintenance / washing of internals.

For example:
- Fluosilisic Acid H₂F₆S₆ Fumes (FSA)
- Reactor Off Gas
- Granulator Emissions

A common technology employed is a Cross-Flow scrubber, where the dirty gas is drawn horizontally through a series of scrubbing and filtration stages. In sequence these stages wet the gas, scrub the gas, and lastly demist the gas, with the option to have a penultimate absorption stage.

The Begg Cousland Cross-Flow Scrubber design is based on BlueFil® meshpad materials made by Benvitec Environment, which are used either as a scrubbing stage packing bed or as a final demister stage.

### Typical Cross-Flow Scrubber Arrangement

This system has many beneficial features. For instance:
- The BlueFil® meshes come in a range of materials and styles. Mostly we use PP or ETFE. The meshpads will be composed of a mix of layers of coarse / medium / fine styles (see BlueFil® Mesh Styles table), to suit each application and customer needs.
- The BlueFil® MX095 mesh has the optimum depth and open volume on the market, reducing pressure loss – not efficiency – and meaning it is easier to wash, slower to block, simpler to install and seal than other meshes.
- The drained spray liquids can be re-cycled in a reverse sequence (stage by stage), to minimize final effluent volume.
- The BlueFil® meshpad panels are installed vertically through access doors on the roof of the vessel. This can be done with front and back grid frames or as layers folded over a top rail inside a metal cassette. In either way they are able to be removed and re-fitted easily for washing.

### 3 Stage Cross-Flow Scrubber Internal Arrangement

</table>

These BlueFil® mesh can replace similar meshes or meshpads with like-for-like specifications or give better efficiency and/or pressure loss and/or blocking resistance.
'BECOFLEX' Rotary Brush Scrubber

A universal, integrated scrubber system to remove solids & liquid particles or to scrub noxious gas emissions.

The ‘BECOFLEX’ has a wetted fibre brush rotating at high speed in a special volute fan casing, which creates an extremely dynamic gas contact.

Particles in the dirty exhaust gas stream are drawn into the unit by the suction generated by the rotary brush, and they impact at high speed with the spinning brush fibres and become thoroughly wetted. The next effect is for the particles to be centrifugally thrown off, to impact on the wetted inner surface of the volute.

The effluent slurry is then propelled along the exit duct to the disengagement vessel, where it falls to the bottom for removal or recirculation.

The cleaned (wet) gas meanwhile flows upwards in the disengagement vessel to a BlueFil® or ‘Becoil’ demister to remove any entrained liquid droplets.

The BECOFLEX system has been successfully used in the Phosphate industry as a stand-alone scrubber package for fugitive fume emission capture from transport wagon loading, discharging or washing. By means of a flexible hose or hood, the Phosphate rock dust and the P2O5 fumes are then drawn into the volute by the suction generated by the rotating brush. The brush is sprayed with water which is recycled from a pump tank.

BECOFLEX BF Units Flow / Suction Options

The Table above shows the Flow rate options for each size of BECOFLEX BF Unit, at 3 different Fan Static Pressure (Suction) values.

For flows larger than 25,000 m³/hr we combine fan volute units in parallel, feeding into a common exit vessel.

BECOFLEX BF Unit Size and Other Data

The Physical Size, Motor Size and Liquid Spray Rate data for each BECOFLEX BF Unit is shown in the table above.

BECOFLEX BF Units Flow / Suction Options

The BECOFLEX brush fibres are made of PP or PVDF so there is a 60 or 100°C temperature limit at the inlet.

The standard materials for the volute and vessel are Carbon Steel, Stainless Steel, Polypropylene / GRP.
'BEGG COUSLAND' Counter-current Packed Bed Fume & Tail Gas Scrubbers

Begg Cousland can design and supply all types of gas scrubbing equipment, either as ‘end-of-pipe’ pollution control or as a gas cleaning stage within a process.

Packed bed scrubbers are designed to give excellent gas / liquid contact and residence time for the reactions, but can be blocked by solid particulates. Where solids are present it is best to use a different design or have a solids removal stage first, for example a Becoflex Rotary Brush Scrubber, to prevent the fouling of the packings.

**Venturi + Wet Cyclone Scrubber**

![A Vertical Scrubber with BlueFil ® Mesh Packing.](image)

In some plants a vertical scrubber design is used, either where the risk of solids blockage is minimal or where space is limited and equipment footprint size is critical.

**Vertical Granulator Scrubber**

![BlueFil ® MX99-10 Pad (not fully assembled)](image)

Some Fluorine scrubbers are vertical and, like the above image of a Granulator Tail Gas Scrubber, can have a 1st stage random packing bed with liquid distributor counter-current followed by a horizontal BlueFil ® Meshpad.
